“Dermaplaning” helps to “refinish” the skin's top layers through a method of controlled surgical scraping. Dermaplaning can be performed on small areas of skin or on the entire face and can be used alone or in conjunction with other procedures such as chemical peels or microdermabrasion. Dermaplaning, when performed prior to other treatments, removes the “peach fuzz” which can trap excess dirt and oil. It is noninvasive and helps make other skin treatments more effective.
